Book Bot

The project simulates a market where agents can buy and sell Books It is book-trading example using multiple buyer/seller agent's creation within the main container.

Seller Agent can offer any book for sale after he identify book type, condition, name, author & price.

Buyer Agent can buy any book offered by the seller agent if he has enough money to buy it and he want to.

the project is initialized with two agent instances a seller and a buyer, but more can be added on runtime.

This is a project we are going to developing it using JADE framework in NetBeans IDE with GUI.
